

# WE CREATE PRODUCTS FOR YOUR BUSINESS

We are technology solutions company specializing in software product and application development

## Mobile Development

Extensive experience working on mobile projects. Mobile apps of any level of complexity.

### Gaming stars

Business niche

eSports, online betting

Time spent

9000 hours

#### At a glance

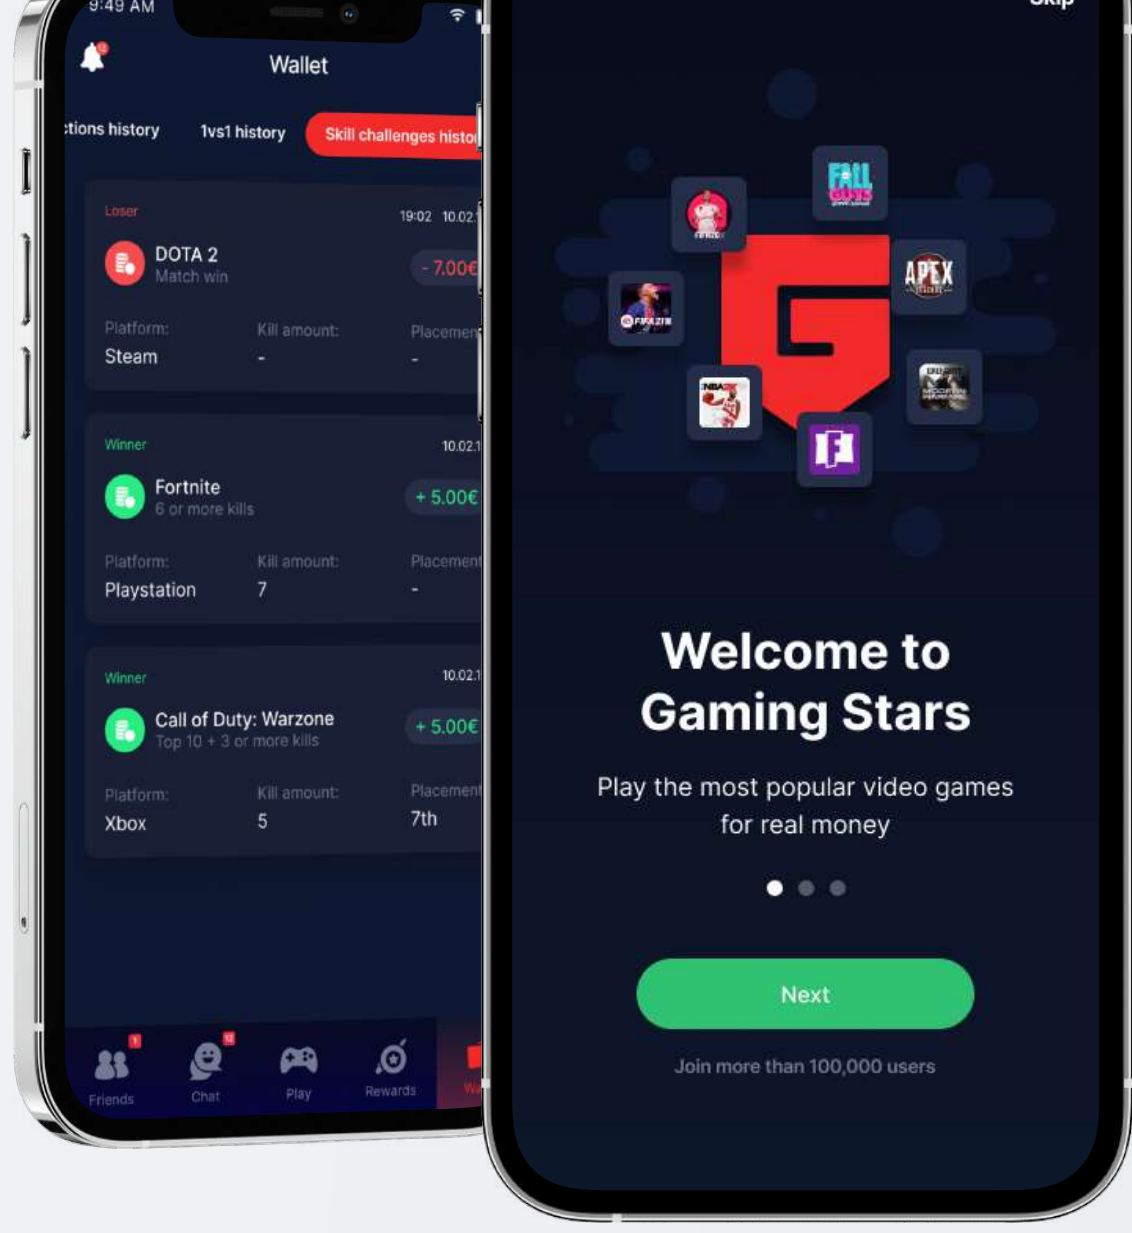

Currently, eSports fans have a common problem: the time spent in the game is still leisure and does not make money. Fortunately, now you do not need to become a super-advanced player with sufficient skills to take part in serious tournaments. This problem is solved with the help of our online solution Gaming Stars, which is monetized and at the same time is not an ordinary gambling product (which means it is compatible with the legislation of the vast majority of states).

#### Results and technical info

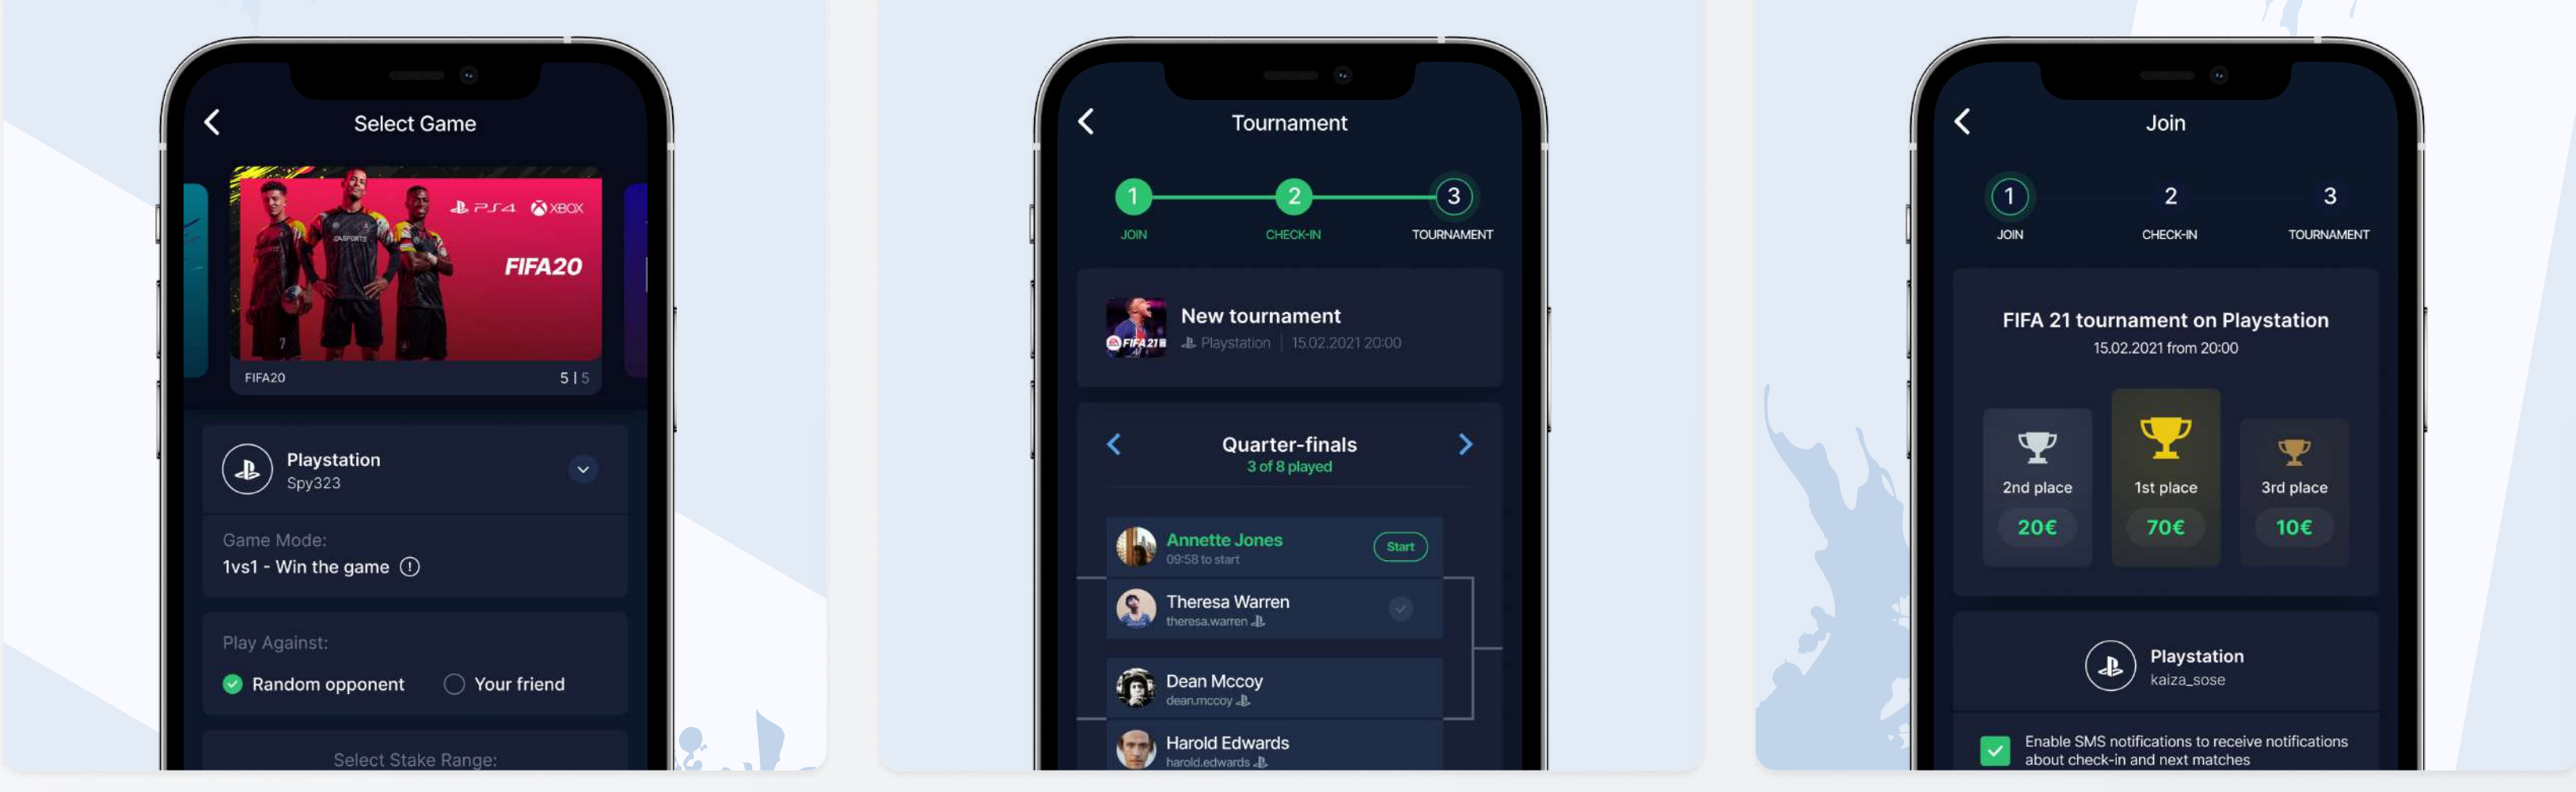

The created solution - allows users to compete in the popular video games around the world. Here we have applied the concept of online poker in full compliance with the law, making the solution monetized. At the same time, the business model of the project cannot be considered a gamble.

The technology stack of this project is:

Python/Django/React/Redux, Java, Web Socket, Django, Celery, Swift, UIKit

### Rocket Lab

Business niche

Social media ad

Time spent

3000 hours

#### At a glance

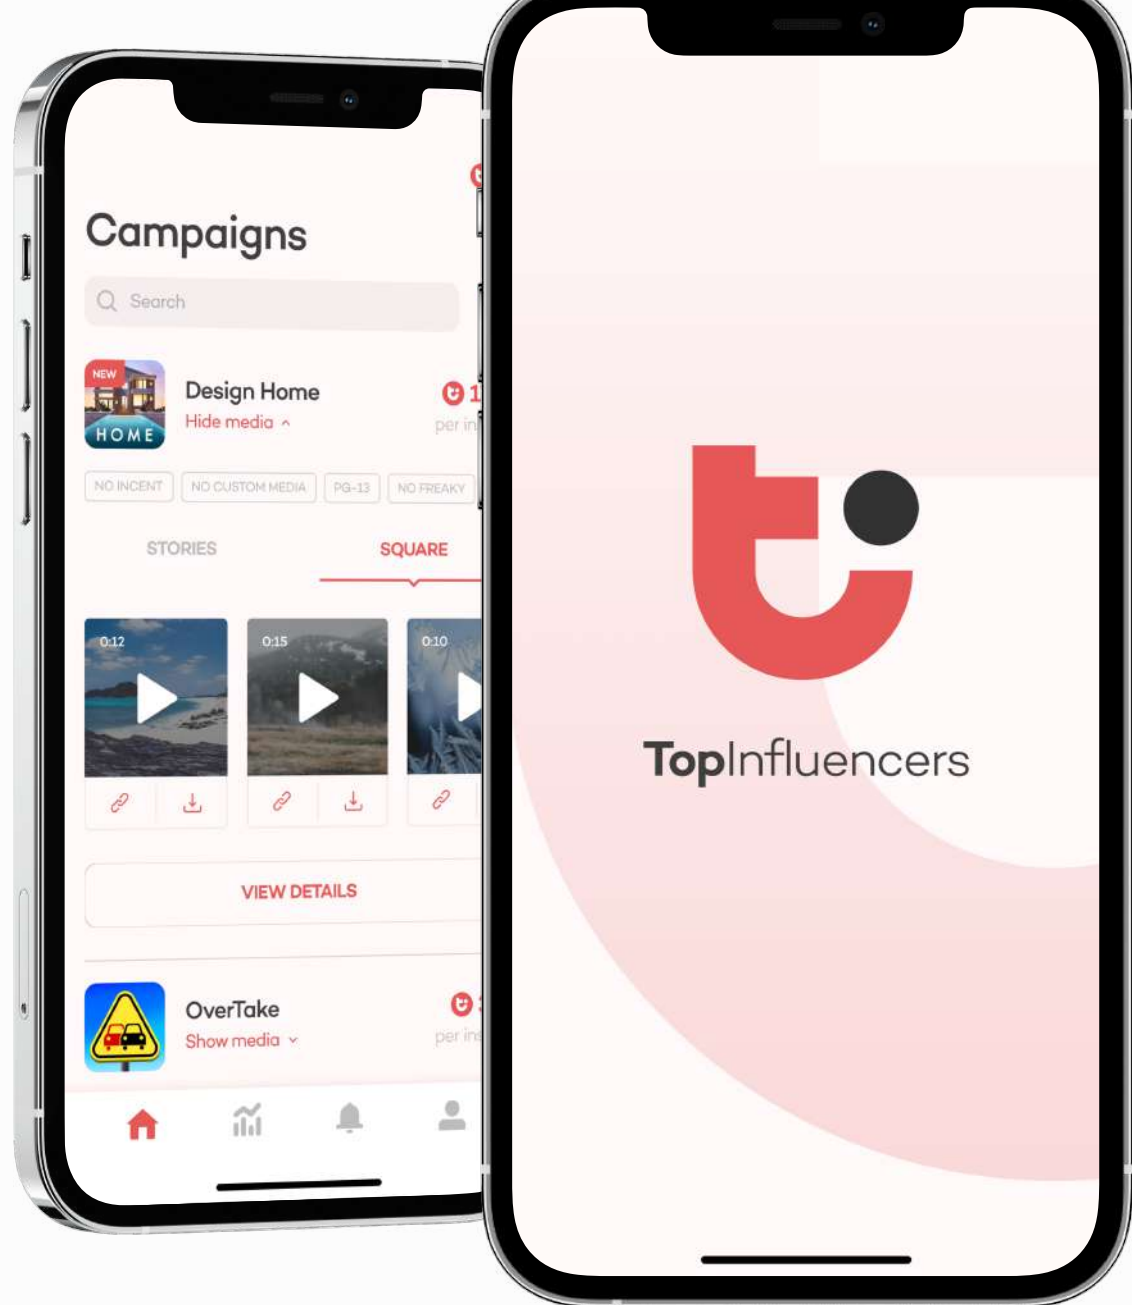

Influencer marketing is the process of communicating and partnering with influencers on social media to promote products or services. Many companies employ influencers to promote new products and include influencer marketing in their advertising strategy to attract new customers. The benefits can be huge if done right. Most social media influencers charge based on the reach of their posts and often promote their content through paid ad services.

#### Results and technical info

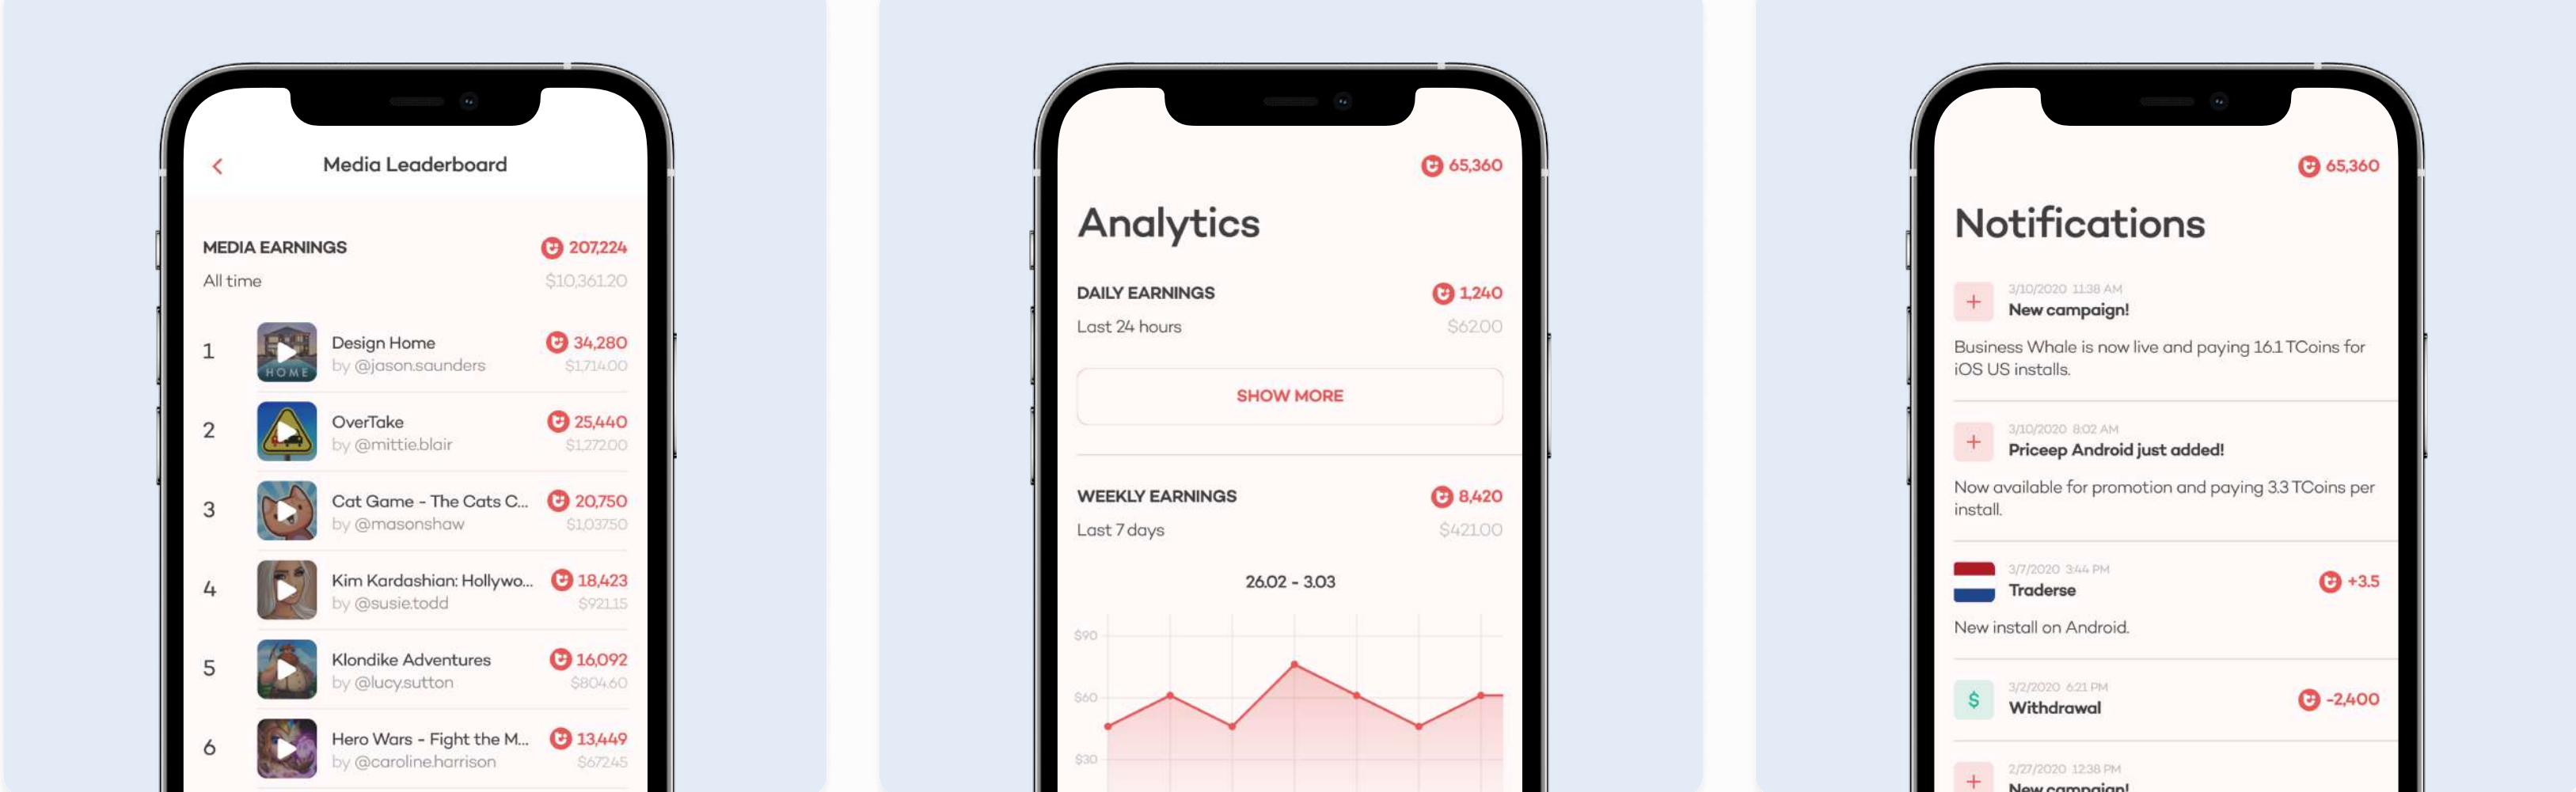

As a result, we have created a platform for interaction between advertisers and influencers. Here, the main interaction tools are advertising videos for social networks (or requirements for them) from advertisers, as well as their publications from influencers.

The technology stack of this project is:

React, Django, Swift, Java, PostgreSQL

### Tip Doc

Business niche

Medical services

Time spent

400 hours

#### At a glance

In our generation the Internet, computers and mobile devices are widely used in everyday life and in all spheres of human activity, including medicine. As for our team we were faced with the task of creating a mobile application that would help a doctor to easily accept foreign patients.

Since the application is to be used during patient examination, it was critical for us to provide simultaneous translation as well as quick search in a medical reference book in all available languages (over 20 different languages).

#### Results and technical info

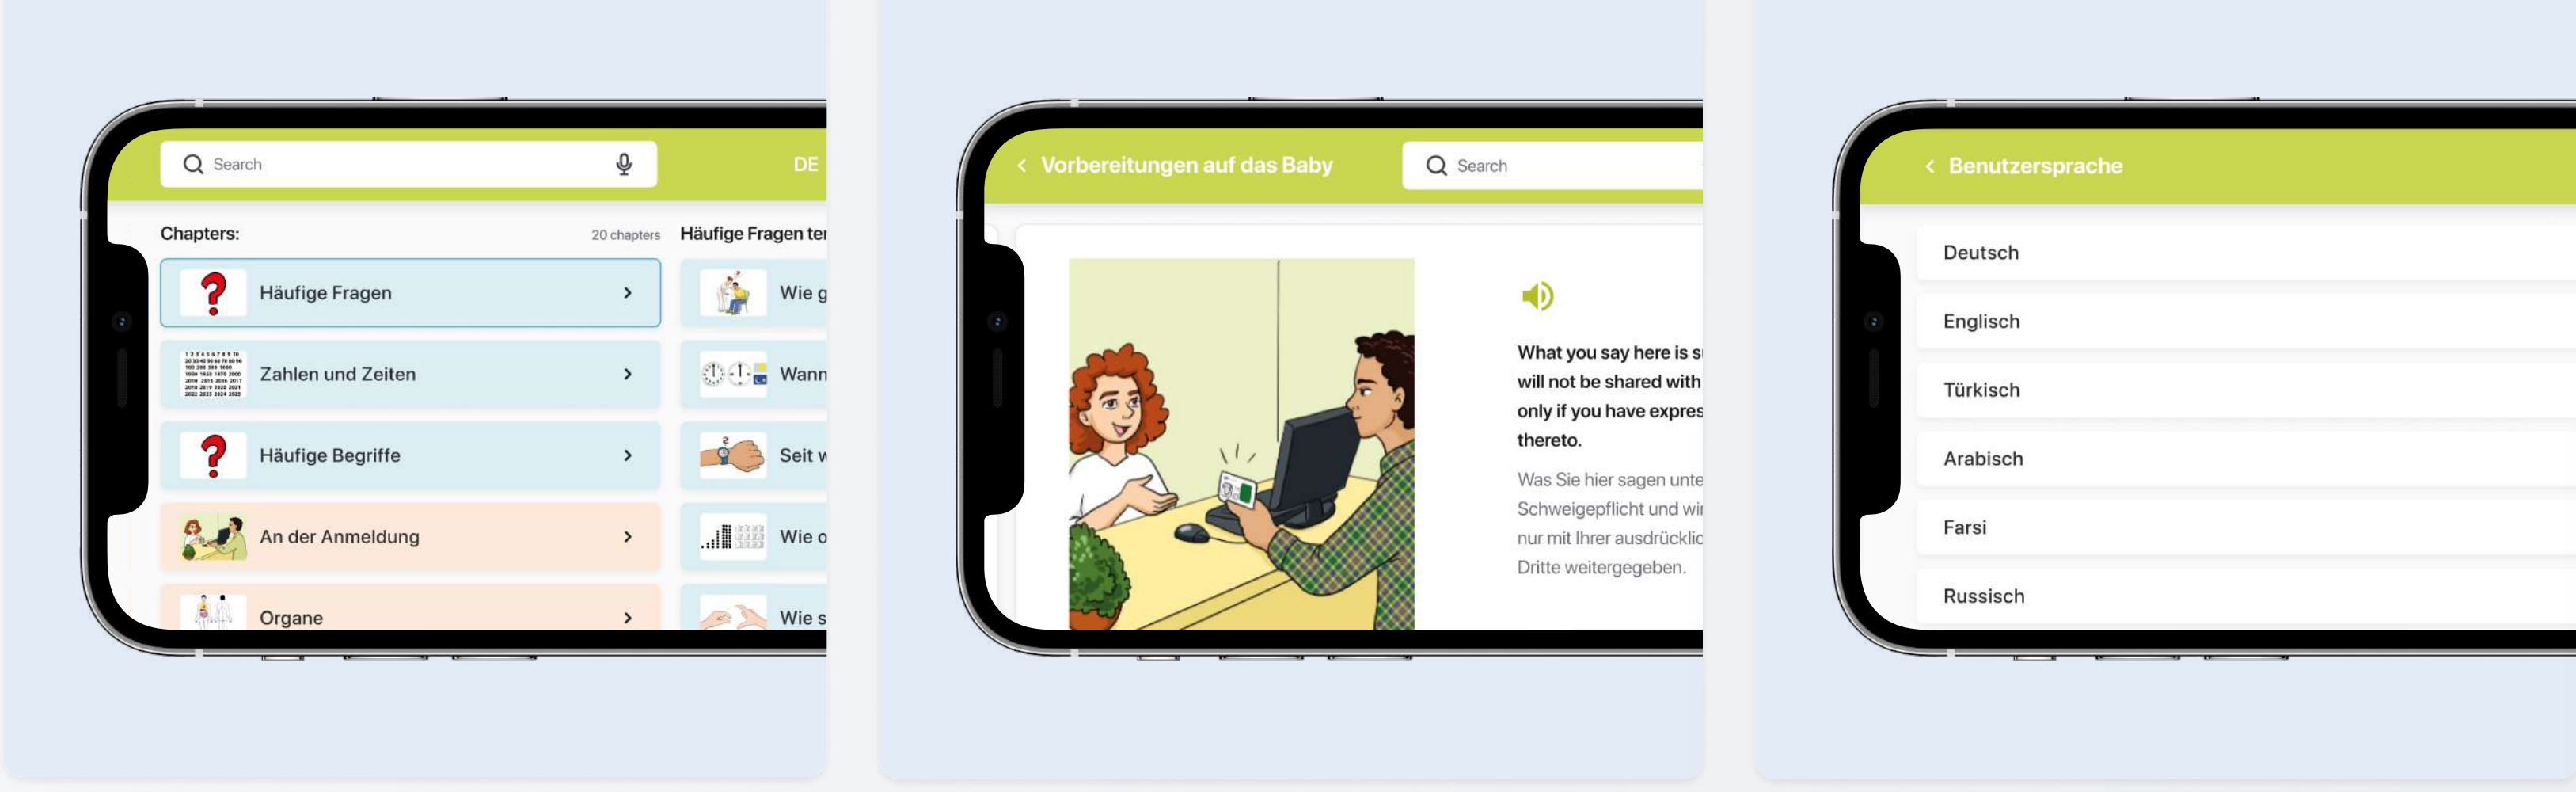

In fact, this is a product for those professionals who prioritize the patient's health, strive to optimize the time of their professional duties and professional development, and also want to apply innovations in their medical practice.

The technology stack of this project is:

React, Django, Python, Swift, Kotlin

### Prorab Helper

Business niche

eCommerce, (DIY) niche

Time spent

4000 hours

#### At a glance

Recently the business community realized that companies should have its own website. Our client - the owner of several warehouses and offline stores selling building materials.

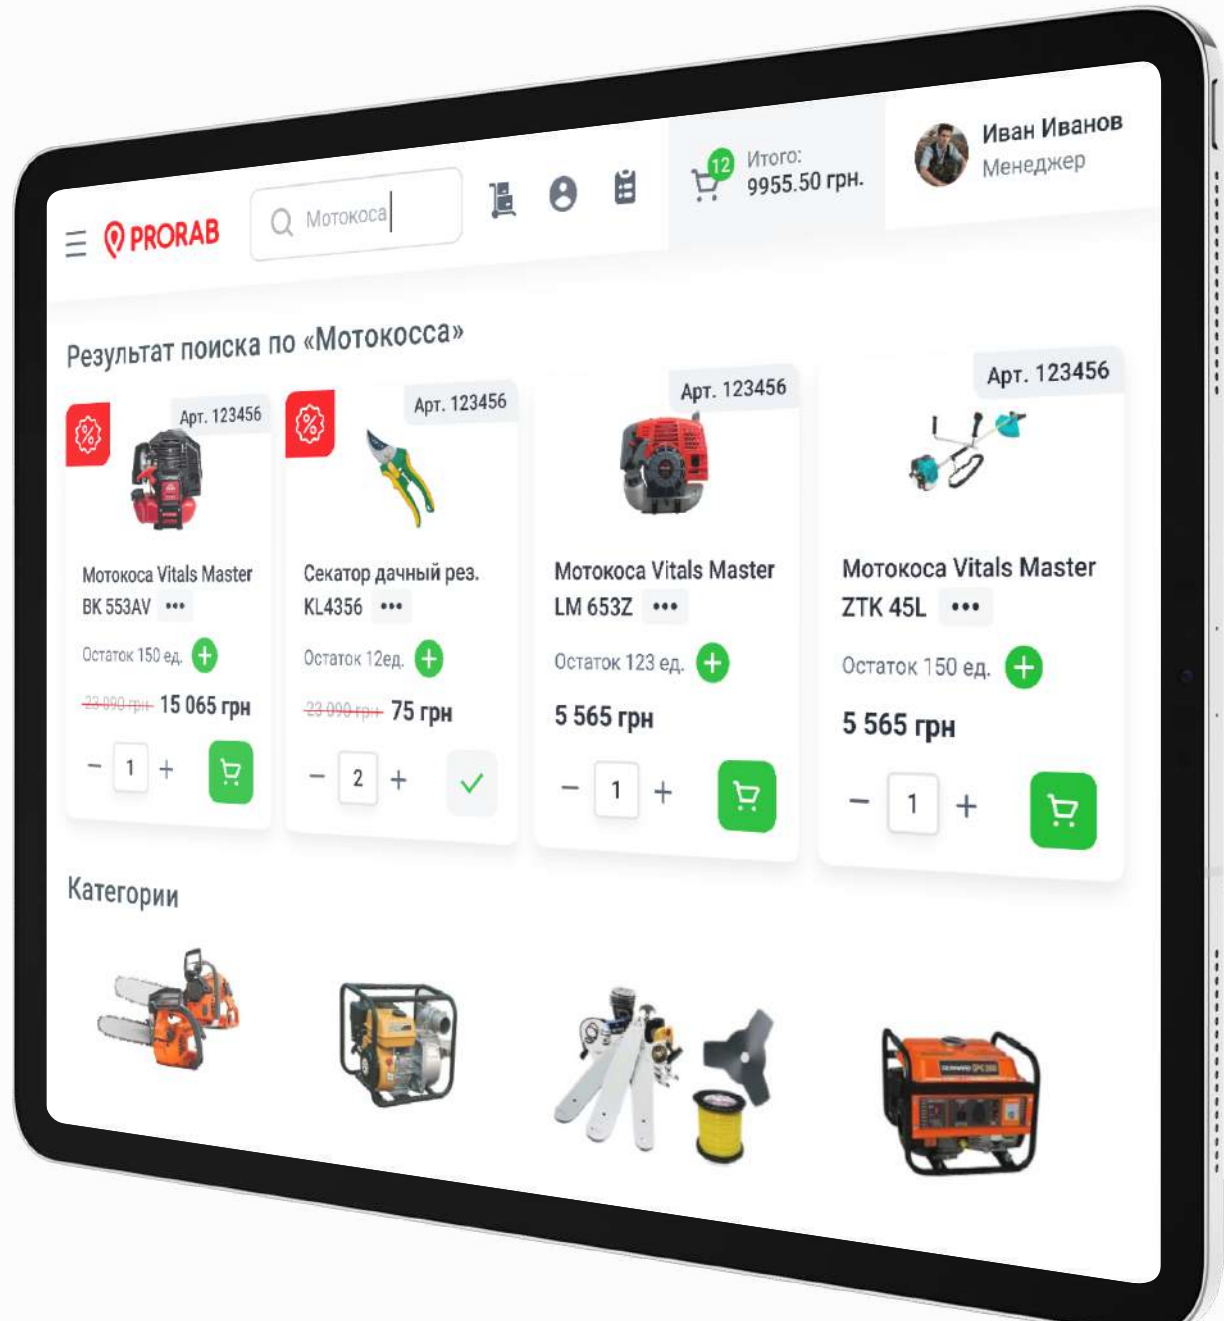

We were tasked with creating not just an ordinary online store for building materials and other DIY goods, but a multi-functional online trading platform that would be able to gradually turn into a marketplace. We also had to create a mobile assistant for consultants of the offline points.

#### Results and technical info

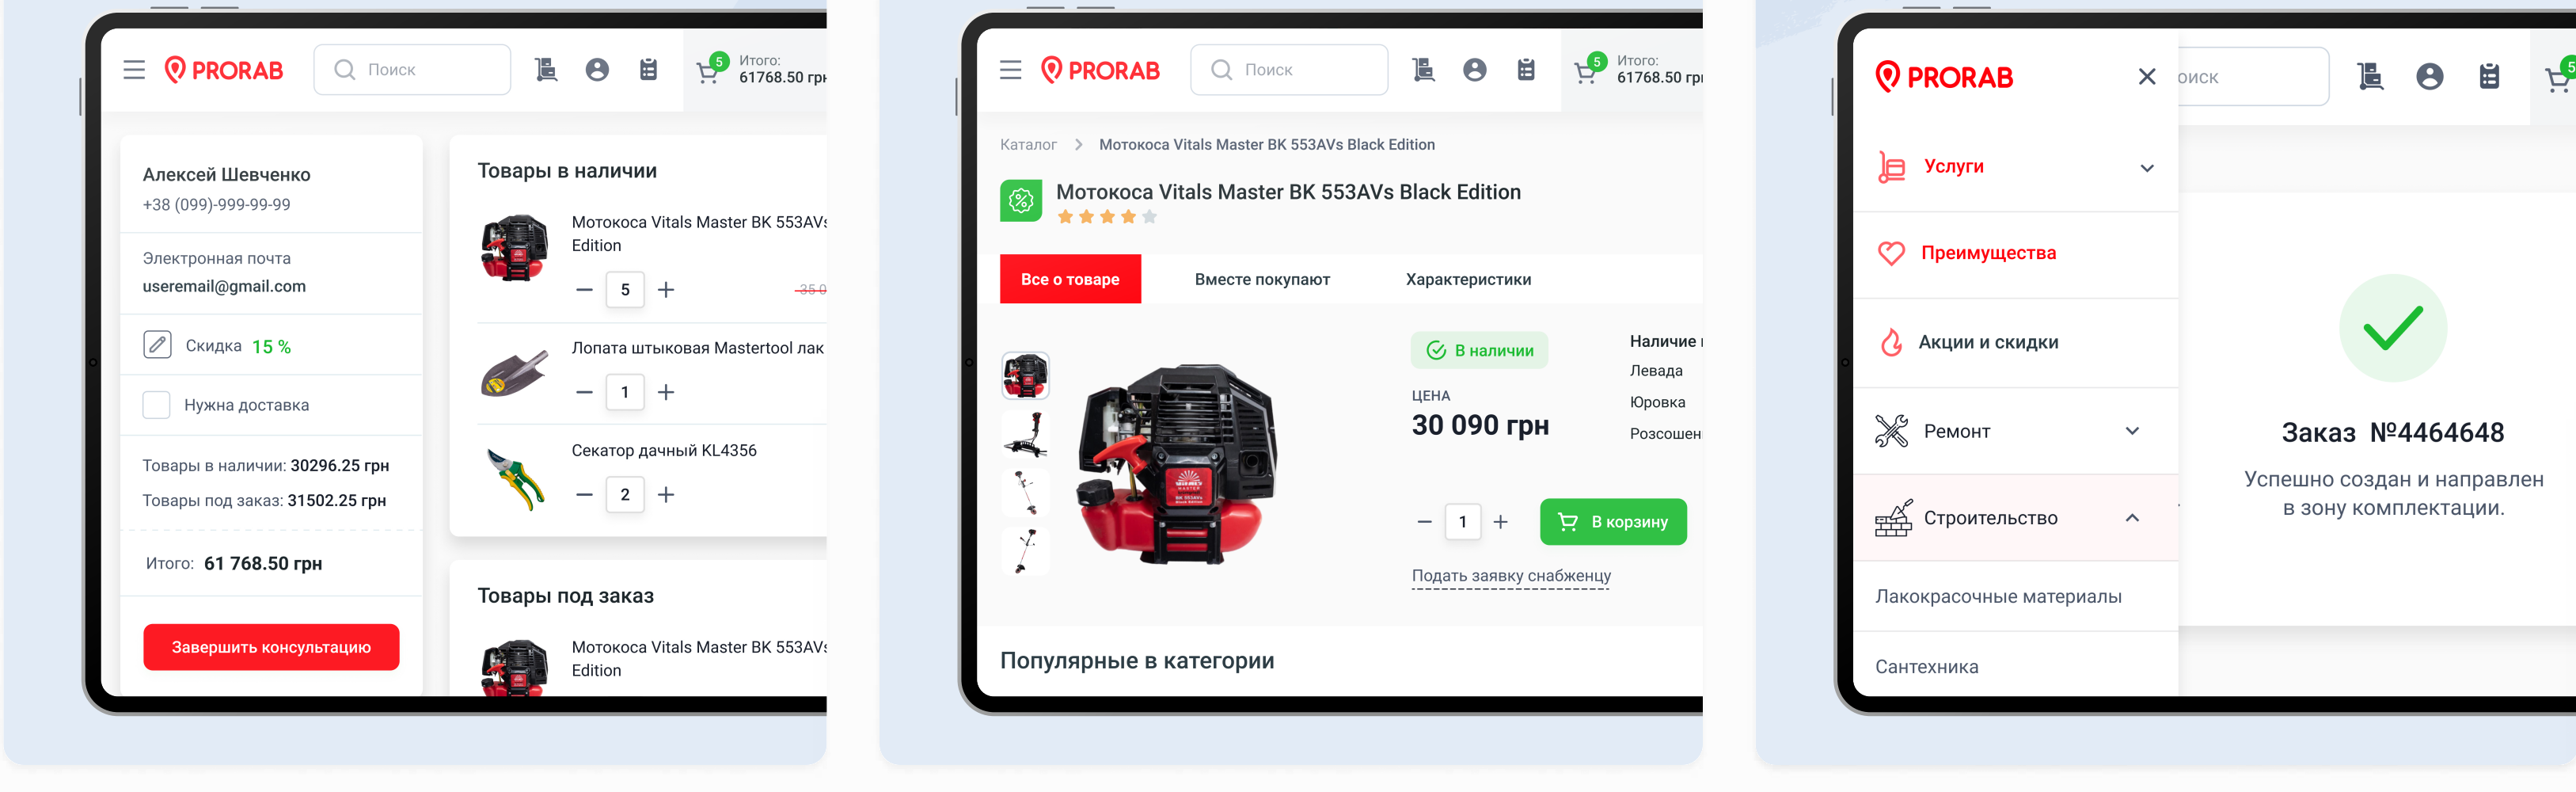

The created solutions are fully adapted for a specific type of business, but, nevertheless, can be easily scaled. Further, we plan to cooperate with the customer in order to gradually modernize the existing trading platform. As for the tablet app, it can also be updated as needed to automate the workflows of employees.

The technology stack of this project is:

Java, React, Django, Python, REST API integration in 1C
